# Module Overview

**Separating state and UI**

**Type checking**

**Routing**

**Context**

**Flux & Redux**

**Ejecting**

**Unit testing**

**Progressive React apps**

# Separating State and UI

**Arguably a best practice**

**Separation of concerns**

**More complex**

# A Practical Start with TypeScript

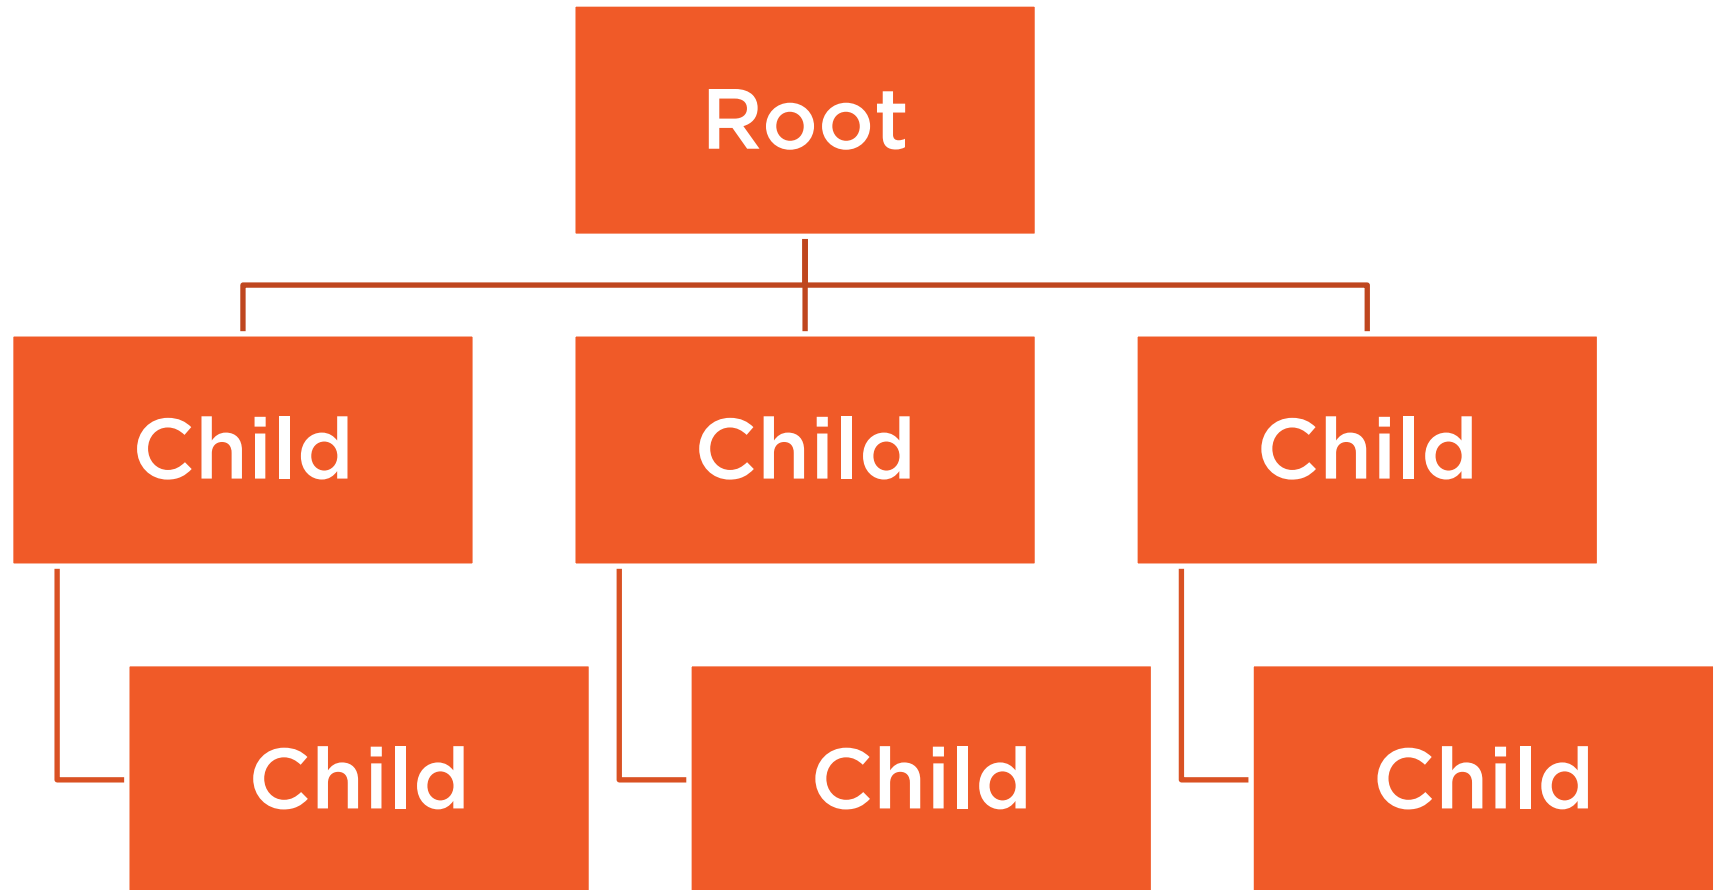

# React Router

Language

Context

# Provider and Consumer

**Support dynamic context**

**Automatic updating**

**Multiple consumers**

# Flux

Architectural pattern

Redux is an implementation

You don't need it until you need it

For complex applications

New concept around state and UI updates

# Flux

# Flux

<https://redux.js.org>

Ejecting: When you want to  
change the create-react-app  
default build configuration

<https://4sh.nl/CustomReactScripts>

<https://4sh.nl/jest>

# Progressive Web App

Service worker

# Progressive Apps

**Great for occasionally connected devices**  
**Potentially extra work**  
**Especially when adding server interaction**

# Summary

Separation of concerns

Easier debugging

Routing URLs

Sharing data

Flux architecture

Taking control of the build pipeline

Unit testing

Progressive web apps
